

**Question 2: Version J**

2. In Scenario 1, a system composed of two springs, A and B, and a block of mass  $m$  is at rest on a horizontal surface. Friction between the block and the surface is negligible. Each spring is attached to a fixed wall and the block, as shown in Figure 1. Spring A has a spring constant  $k$  and Spring B has a spring constant  $2k$ . Each spring is at its relaxed length when the block is at position  $x = 0$ , as shown.

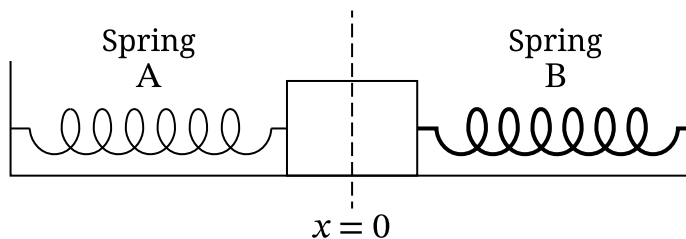

Figure 1

The block is moved to  $x = x_1$  and held at rest, as shown in Figure 2.

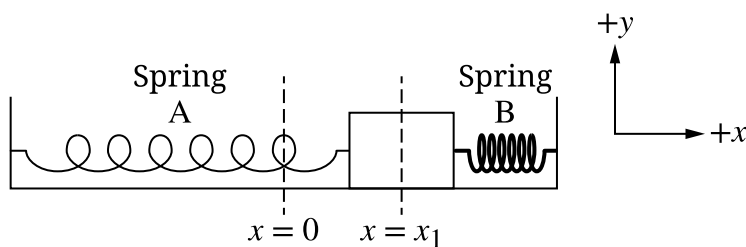

Figure 2

A. An energy bar chart can be used to represent the elastic potential energy  $U_A$  of Spring A, the elastic potential energy  $U_B$  of Spring B, and the kinetic energy  $K_{\text{block}}$  of the block. On the energy bar chart in Figure 3, **draw** shaded bars to represent the energy of the system for when the block is at  $x = x_1$ .

- The height of the shaded bars should be proportional to the relative values of  $U_A$ ,  $U_B$ , and  $K_{\text{block}}$ .
- Any energy that is equal to zero should be represented by a distinct line on the zero-energy line.

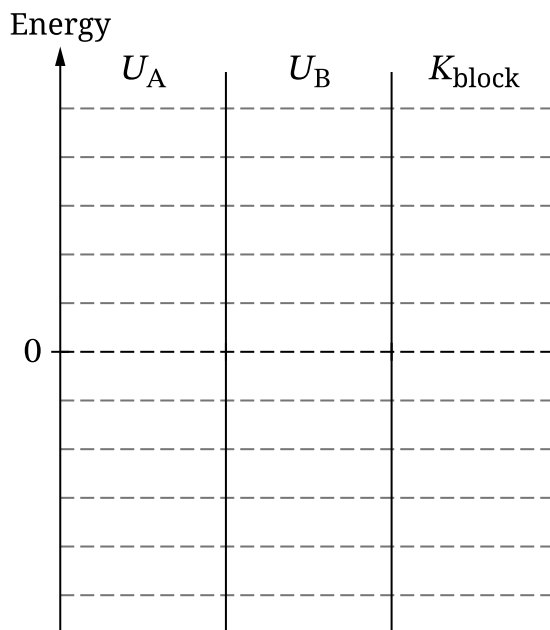

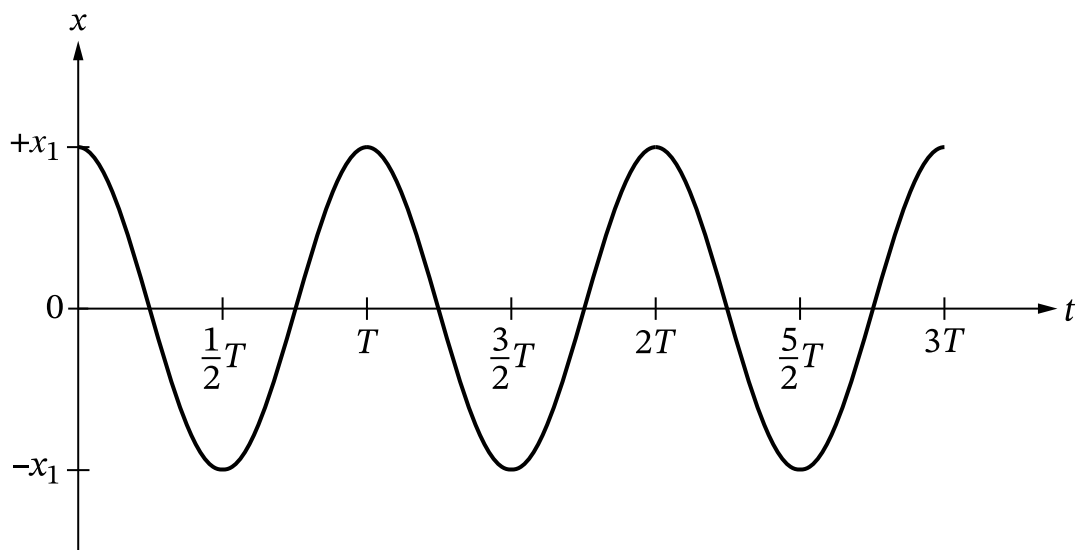

Figure 3

B. The block is released from rest at  $x = x_1$  and begins to oscillate. **Derive** an expression for the speed  $v$  of the block as the block passes through  $x = \frac{1}{2}x_1$ . Express your answer in terms of  $m$ ,  $k$ ,  $x_1$ , and physical constants, as appropriate. Begin your derivation by writing a fundamental physics principle or an equation from the reference information.

- C. In Scenario 1, the block oscillates with period  $T$ . The position  $x$  of the block in Scenario 1 as a function of time  $t$  is shown in Figure 4.

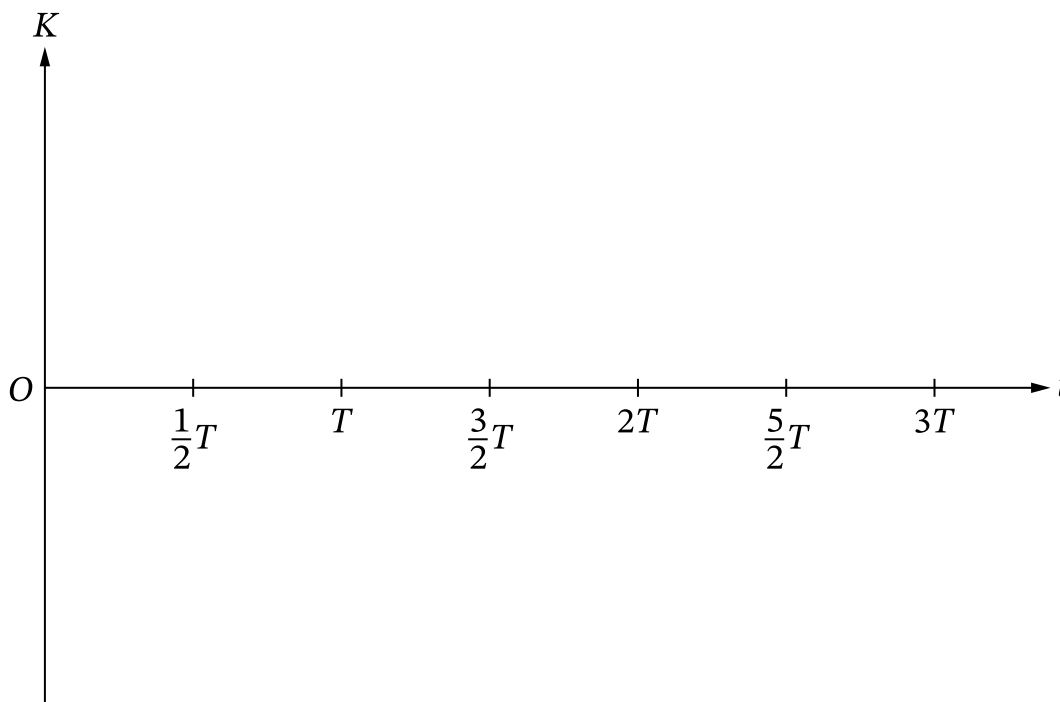

Scenario 1

Figure 4

In Scenario 2, the block-springs system is placed on a new surface. There is friction between the block and the new surface. The block is again moved to the same position  $x = x_1$  and released from rest. The block completes multiple oscillations with the same period as in Scenario 1 before coming to rest.

On the axes shown in Figure 5, **sketch** a graph of the kinetic energy  $K$  of the block as a function of  $t$  for Scenario 2.

Scenario 2

Figure 5

- D.** In Scenario 3, the block is replaced with a new block of larger mass. The coefficient of kinetic friction between the new block and the surface in Scenario 3 is the same as the coefficient of kinetic friction between the original block and the surface in Scenario 2.

The new block is moved to position  $x = x_1$  and released from rest. The kinetic energy of the new block is plotted as a function of time.

**Describe** how one feature of the graph of  $K$  as a function of  $t$  in Scenario 3 would differ from the graph you drew in Figure 5 for Scenario 2.

Briefly **justify** your answer.

**Question 2: Translation Between Representations (TBR)****12 points**

<b>A</b>	For indicating that $K_{\text{block}}$ is zero	<b>Point A1</b>
	For drawing bars with positive heights for $U_A$ and $U_B$	<b>Point A2</b>
	For drawing a bar for $U_B$ with a height that is twice the height of the bar drawn for $U_A$	<b>Point A3</b>
<b>Scoring Note:</b> This point may be earned regardless of the signs of either bar.		

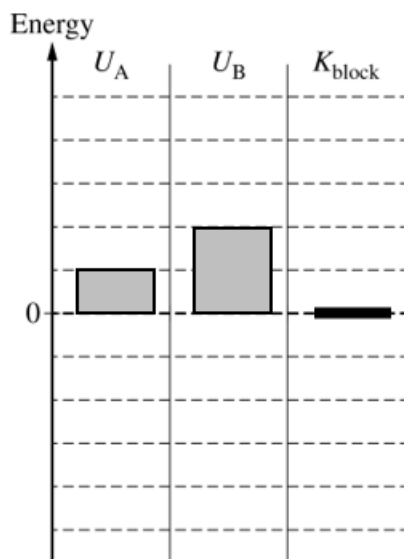

**Example Response**

Figure 3

<b>B</b>	For a multistep derivation that includes energy conservation or simple harmonic motion	<b>Point B1</b>
	For relating the presence of both springs to the behavior of the system	<b>Point B2</b>
	For relating positions $x = x_1$ and $x = \frac{1}{2}x_1$ to the oscillation of the block	<b>Point B3</b>
	For a correct expression for $v$ in terms of given quantities	<b>Point B4</b>
