

2017 AP[®] ENVIRONMENTAL SCIENCE FREE-RESPONSE QUESTIONS

- (a) Using the data provided in the table above, **plot** the elephant population data as points on the grid below, placing the independent variable on the x -axis. Clearly **label** the axes.

- (b) **Calculate** the percent loss of elephants in Africa from 1970 to 2000. Show all work.
- (c) The International Union for Conservation of Nature (IUCN) estimates that the elephant population will decline by 20 percent between 2015 and 2022. Use this estimate to **calculate** how many elephants will be left in Africa in 2022. Show all work.
- (d) Most large terrestrial mammals are K-strategists. **Identify** one characteristic of a K-strategist and **explain** how the characteristic you identified can make these mammals prone to extinction.
- (e) **Identify** and **discuss** TWO conservation strategies that could be implemented to prevent the extinction of large terrestrial mammals, such as the African elephant or snow leopard.

2017 AP[®] ENVIRONMENTAL SCIENCE FREE-RESPONSE QUESTIONS

4. Dams are built by humans for various purposes including hydroelectric power generation and control of downstream flooding.
- (a) **Explain** how electricity is generated at a hydroelectric dam.
 - (b) **Identify** TWO economic benefits, other than hydroelectric power generation and control of downstream flooding, associated with dams.
 - (c) **Describe** one ecological benefit of seasonal flooding of the floodplain of a free-flowing river.
 - (d) Some dams have been removed from rivers.
 - (i) **Explain** how removal of a dam can benefit fish populations.
 - (ii) **Describe** one negative environmental consequence of removing a dam from a river (other than effects on fish populations).
 - (e) Dams are also built by beavers, a keystone species in some North American ecosystems.
 - (i) **Define** keystone species.
 - (ii) **Describe** how dams built by beavers can make beavers a keystone species in some ecosystems.

2017 SCORING GUIDELINES

Question 4

Dams are built by humans for various purposes including hydroelectric power generation and control of downstream flooding.

- (a) **Explain** how electricity is generated at a hydroelectric dam.

(3 points: 1 point for a description of each step in the process of generating electricity at a hydroelectric dam.)

Step	Description of Step
Water moves	<ul style="list-style-type: none">• Water falls/drops• Water is directed to a turbine• Potential energy → kinetic energy
Turbine rotates	<ul style="list-style-type: none">• Water turns/rotates a turbine• Kinetic energy → mechanical energy
Electricity produced	<ul style="list-style-type: none">• Turbines turn/drive a generator• Rotation converted to electricity• Mechanical energy → electricity

- (b) **Identify** TWO economic benefits, other than hydroelectric power generation and control of downstream flooding, associated with dams.

(2 points: 1 point for each correct identification of an economic benefit. Only the first two identifications can earn a point.)

- Recreation/tourism
- Job creation
- Provision of water for domestic, industrial, or agricultural use
- Commercial fisheries
- Commercial shipping

- (c) **Describe** one ecological benefit of seasonal flooding of the floodplain of a free-flowing river.

(1 point for a correct description of an ecological benefit of seasonal flooding of the floodplain.)

- Flooding can deposit nutrients/increase soil fertility
- Sediment can create banks
- Sediment can build/replenish soil
- Overflow can deposit seeds
- Flooding can recharge the aquifer
- Overflow can create/maintain habitat for fish and birds (e.g., riparian zones, wetlands)
- Flooding can decrease soil/water salinization

2017 SCORING GUIDELINES**

Question 4 (continued)

(d) Some dams have been removed from rivers.

(i) **Explain** how removal of a dam can benefit fish populations.

(1 point for correct explanation of how dam removal benefits fish populations.)

- Restoration of wetland/riparian habitats supports fish populations
- Removal of barrier allows fish migration/increases access to habitats/mates
- Removal of dam turbines/spillway decreases fish mortality
- Restoration of pre-dam conditions (e.g. water temperature, habitat, dissolved oxygen, turbidity) benefits native species

(ii) **Describe** one negative environmental consequence of removing a dam from a river (other than effects on fish populations).

(1 point for correct description of a negative environmental consequence of dam removal.)

- Loss of lake habitat/species or downstream habitat/species following restoration of pre-dam conditions
- Increased deposition of sediment downstream
- Erosion of stream banks by high flow following rapid dam removal
- Increased turbidity from release of silt/sediment
- Movement of pollutants accumulated behind the dam downstream
- Change of water temperatures downstream
- Spread of invasive species

(e) Dams are also built by beavers, a keystone species in some North American ecosystems.

(i) **Define** keystone species.

(1 point for a correct definition of a keystone species.)

- Has a large effect on its environment relative to its abundance
- Increases ecosystem stability OR reduces ecosystem stability when absent

(ii) **Describe** how dams built by beavers can make beavers a keystone species in some ecosystems.

(1 point for a description of how beaver dams transform their environment linked to impact on other species.)

- Creation of habitats/alteration of existing habitat
- Fewer floods maintains habitat stability
- Removal of water-borne pollutants increases survival of aquatic life
- Entrapment of sediments behind dam creates habitat/reduces turbidity
- Reduction of erosion of stream banks
