

**2004 AP<sup>®</sup> PHYSICS C: ELECTRICITY AND MAGNETISM  
FREE-RESPONSE QUESTIONS**

**PHYSICS C**

**Section II, ELECTRICITY AND MAGNETISM**

**Time—45 minutes**

**3 Questions**

**Directions:** Answer all three questions. The suggested time is about 15 minutes for answering each of the questions, which are worth 15 points each. The parts within a question may not have equal weight. Show all your work in the booklet in the spaces provided after each part, NOT in this green insert.

E&M. 1.

The figure above left shows a hollow, infinite, cylindrical, uncharged conducting shell of inner radius  $r_1$  and outer radius  $r_2$ . An infinite line charge of linear charge density  $+\lambda$  is parallel to its axis but off center. An enlarged cross section of the cylindrical shell is shown above right.

- (a) On the cross section above right,
- sketch the electric field lines, if any, in each of regions I, II, and III and
  - use + and – signs to indicate any charge induced on the conductor.
- (b) In the spaces below, rank the electric potentials at points  $a$ ,  $b$ ,  $c$ ,  $d$ , and  $e$  from highest to lowest (1 = highest potential). If two points are at the same potential, give them the same number.

\_\_\_\_\_  $V_a$                       \_\_\_\_\_  $V_b$                       \_\_\_\_\_  $V_c$                       \_\_\_\_\_  $V_d$                       \_\_\_\_\_  $V_e$

FREE-RESPONSE QUESTIONS**

Cross Section

- (c) The shell is replaced by another cylindrical shell that has the same dimensions but is nonconducting and carries a uniform volume charge density  $+\rho$ . The infinite line charge, still of charge density  $+\lambda$ , is located at the center of the shell as shown above. Using Gauss's law, calculate the magnitude of the electric field as a function of the distance  $r$  from the center of the shell for each of the following regions. Express your answers in terms of the given quantities and fundamental constants.
- $r < r_1$
  - $r_1 \leq r \leq r_2$
  - $r > r_2$

FREE-RESPONSE QUESTIONS**

E&M. 2.

In the circuit shown above left, the switch  $S$  is initially in the open position and the capacitor  $C$  is initially uncharged. A voltage probe and a computer (not shown) are used to measure the potential difference across the capacitor as a function of time after the switch is closed. The graph produced by the computer is shown above right. The battery has an emf of 20 V and negligible internal resistance. Resistor  $R_1$  has a resistance of  $15\text{ k}\Omega$  and the capacitor  $C$  has a capacitance of  $20\text{ }\mu\text{F}$ .

- (a) Determine the voltage across resistor  $R_2$  immediately after the switch is closed.
- (b) Determine the voltage across resistor  $R_2$  a long time after the switch is closed.
- (c) Calculate the value of the resistor  $R_2$ .
- (d) Calculate the energy stored in the capacitor a long time after the switch is closed.

**AP<sup>®</sup> PHYSICS C ELECTRICITY & MAGNETISM  
2004 SCORING GUIDELINES**

**Question 1**

**15 points total**

**Distribution  
of points**

(a)

i. 3 points

For field lines inside the shell that point outward and are reasonably close to being  $90^\circ$  to both the line charge and the shell surface, with obviously more lines on the right side than the left

1 point

For field lines outside the shell that are radial and noncontinuous with those inside the shell, reasonably close to  $90^\circ$  to the shell surface, and approximately evenly spaced

1 point

For no field lines inside the shell, given that there are field lines drawn elsewhere

1 point

ii. 2 points

For only negative charges on the inside surface of the shell, with obviously more charges on the right side

1 point

For only positive charges on the outside of the shell, approximately evenly spaced

1 point
