

Begin your response to **QUESTION 1** on this page.

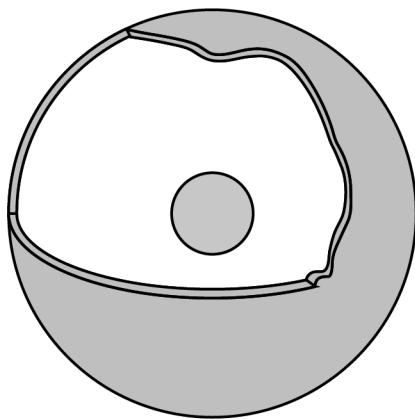

**PHYSICS C: ELECTRICITY AND MAGNETISM**

**SECTION II**

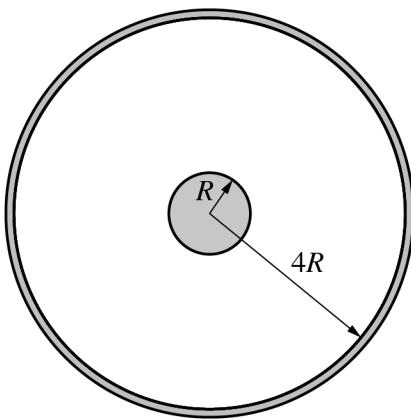

**Time—45 minutes**

**3 Questions**

**Directions:** Answer all three questions. The suggested time is about 15 minutes for answering each of the questions, which are worth 15 points each. The parts within a question may not have equal weight. Show all your work in this booklet in the spaces provided after each part.

Cutout View

Cross-Section View

Note: Figures not drawn to scale.

1. A nonconducting sphere of uniform volume charge density is surrounded by a thin concentric conducting spherical shell, as shown in the cutout view. The sphere has a charge of  $-Q$  and the shell has a charge of  $+3Q$ . The radii of the inner sphere and spherical shell are  $R$  and  $4R$ , respectively, as shown in the cross-section view.  
(a) Determine the charge on the outer surface of the shell.

- (b) Using Gauss's law, derive an expression for the electric field a distance  $r$  from the center of the sphere for  $r < R$ . Express your answer in terms of  $Q$ ,  $R$ ,  $r$ , and physical constants, as appropriate.
- (c) The magnitude of the electric field at  $r = R$  is  $8\text{N/C}$ . Calculate the value of the electric field at  $r = 2R$ .
- (d) Derive an expression for the absolute value of the potential difference between the outer surface of the sphere and the inner surface of the shell. Express your answer in terms of  $Q$ ,  $R$ , and physical constants, as appropriate.

(e)

- i. On the following axes that include regions I, II, and III, sketch a graph of the electric field  $E$  as a function of the distance  $r$  from the center of the sphere.

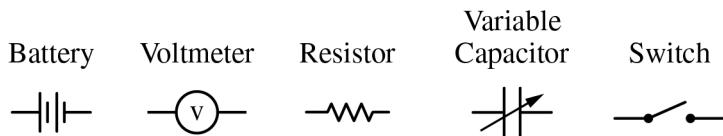

- ii. On the following axes that include regions I, II, and III, sketch a graph of the electric potential  $V$  as a function of the distance  $r$  from the center of the sphere.

Begin your response to **QUESTION 2** on this page.

2. The plates of a certain variable capacitor have an adjustable area. An experiment is performed to study the potential difference across the capacitor as it discharges through a resistor. A circuit is to be constructed with the following available equipment: a single ideal battery of potential difference  $\Delta V_0$ , a single voltmeter, a single resistor of resistance  $R$ , a single uncharged variable capacitor set to capacitance  $C$ , and one or more switches as needed.

- (a) Using the symbols shown, draw a schematic diagram of a circuit that can charge the capacitor and may also be used to study the potential difference across the capacitor as it discharges through the resistor.

The capacitor is fully charged by the battery. At time  $t = 0$ , the capacitor starts discharging through the resistor.

- (b) Show that the potential difference  $\Delta V_C$  across the capacitor as a function of time  $t$  is  $\Delta V_C(t) = \Delta V_0 e^{-\frac{t}{RC}}$  as the capacitor discharges.
