

**2011 AP® ENVIRONMENTAL SCIENCE FREE-RESPONSE QUESTIONS**

**ENVIRONMENTAL SCIENCE  
SECTION II  
Time—90 minutes  
4 Questions**

**Directions:** Answer all four questions, which are weighted equally; the suggested time is about 22 minutes for answering each question. Write all your answers on the pages following the questions in the pink booklet. Where calculations are required, clearly show how you arrived at your answer. Where explanation or discussion is required, support your answers with relevant information and/or specific examples.

1. Read the following article from the *Fremont Inquirer* and answer the questions that follow.

**Fremont Inquirer**

## **BEETLES BOOM BUT BEES BUST**

We share our world with millions of insect species that we tend to overlook in our daily lives. Yet once in a while, some insect species do make the front page — sometimes because their populations are exploding and other times because they seem to be performing a disappearing act. Examples of such species are the mountain pine beetle and the European honeybee.

In the western United States, outbreaks of forest destruction caused by mountain pine beetles have been recorded since the late 1880s. But in the past few decades, mountain pine beetles have been killing mature trees (preferred targets of the beetles) at accelerated rates, and now millions of acres of pine forests have been affected. Fire-suppression policies, the practice of clear-cutting, and lowered winter mortality of beetle larvae have all

been implicated in causing the epidemic proportions of the beetles' forest-destroying activities.

While mountain pine beetle populations are booming, European honeybees are in trouble. Many valuable food crops are dependent on pollination by honeybees, yet the number of managed honeybee colonies has dropped significantly since the 1970s due to colony collapse disorder (CCD), which is characterized by the sudden disappearance of all the worker bees in a colony. Recent scientific research suggests that many stress factors of anthropogenic origin are the culprits in CCD. Some farmers are trying to use fewer colonies to pollinate their crops, some are hoping that other natural pollinators (e.g., native wild bees, other insects, bats) will do the job of pollination for them.

- (a) As mentioned in the article, there are several possible explanations for the increase in mountain pine beetles.
  - (i) Provide one reason why fire-suppression policies lead to increased beetle activity.
  - (ii) Reduced winter mortality of beetle larvae is likely a consequence of global climate change. Describe TWO ways that the activities of the beetles might enhance climate change.

**AP® ENVIRONMENTAL SCIENCE  
2011 SCORING GUIDELINES**

**Question 1**

**(a) As mentioned in the article, there are several possible explanations for the increase in mountain pine beetles.**

**(i) Provide one reason why fire-suppression policies lead to increased beetle activity.**

*(1 point; only the first answer is scored.)*

- Suppression leads to increased numbers of trees/more food/denser forests.
- Suppression allows weaker, more vulnerable trees that would have been weeded out by fire to survive.
- Suppression leads to less diversity of tree species, so beetles spread more quickly between trees.
- Suppression leads to equal/even-age stands of mature trees, which the beetles prefer.

**(ii) Reduced winter mortality of beetle larvae is likely a consequence of global climate change. Describe TWO ways that the activities of the beetles might enhance climate change.**

*(2 points; 1 point for each activity. Only the first two answers are scored.)*

- Less carbon dioxide is removed by trees (less photosynthesis/primary production/carbon sinks/carbon sequestration).
- Higher levels of dead tree matter release more carbon dioxide through decomposition.
- Burning of forests as a result of infestation (dead trees) releases carbon dioxide.

*Note:* Carbon dioxide released by beetle respiration is NOT an acceptable answer.

**(b) The widespread death of trees leads to a series of changes in a forest ecosystem. Identify TWO physical changes that occur in the forest ecosystem as the result of the death of mature trees. For each physical change you identify, describe an impact of that change on the forest ecosystem.**

*(4 points; 1 point for each identification and 1 point for each description. The description must be LINKED to the identification. Only the first two answers are scored.)*

<b>Physical change</b>	<b>Impact on ecosystem</b>
Habitat loss (loss of foliage, branches, physical structures provided by trees)	<ul style="list-style-type: none"><li>• Loss of biodiversity.</li><li>• Loss of shelter (nesting/breeding).</li><li>• Animal species migrate or die.</li><li>• Loss of food.</li><li>• Increased competition for food/shelter.</li></ul>
Increased sunlight reaching the ground	<ul style="list-style-type: none"><li>• Growth of younger trees because of reduced competition for light.</li><li>• Shift in species because of changing light conditions.</li><li>• Increased habitat for species in downed trees and/or snags.</li><li>• Loss of species that cannot tolerate higher temperatures.</li><li>• Increased evaporation from waterways reduces flows.</li><li>• Faster evaporation of snowcover reduces snowmelt in spring and reduces flows.</li><li>• Increased sunlight results in decreased snowcover.</li></ul>

**AP® ENVIRONMENTAL SCIENCE  
2011 SCORING GUIDELINES**

**Question 1 (continued)**

Increased erosion/decreased root systems/increased runoff	<ul style="list-style-type: none"> <li>• Loss of nutrients for plants.</li> <li>• Loss of root zone for plant stability.</li> <li>• Increased siltation/sedimentation.</li> <li>• Change in stream and river depth leads to changes in plant and animal species.</li> <li>• Changes in water clarity leads to reduced primary productivity.</li> <li>• Mortality of animal and plant species that are buried by sediment.</li> </ul>
Less absorption of precipitation by trees	<ul style="list-style-type: none"> <li>• Increased runoff.</li> <li>• Increased erosion.</li> <li>• Loss of nutrients (leaching or runoff).</li> <li>• Mortality of plant species (waterlogging).</li> <li>• Mortality or migration of animal species.</li> <li>• Decreased local water vapor/drier climate.</li> </ul>
Increased flooding	<ul style="list-style-type: none"> <li>• Loss of nutrients (leaching).</li> <li>• Mortality of plant species (waterlogging).</li> <li>• Mortality or migration of animal species.</li> </ul>
Increased soil temperature	<ul style="list-style-type: none"> <li>• Changes in plant growth.</li> <li>• Changes in soil communities (microbes and invertebrates).</li> </ul>
Downed trees or snags	<ul style="list-style-type: none"> <li>• Increased habitat for species.</li> <li>• Risk of catastrophic fires.</li> <li>• Increased nutrients from tree decomposition.</li> </ul>

(c) As the article states, the number of managed honeybee colonies has dropped significantly over the past few decades. Describe TWO specific economic consequences of the collapse of the managed honeybee colonies.

(2 points; 1 point for each consequence linked to a description. Only the first two answers are scored.)

<b>Economic consequence</b>	<b>Description</b>
<ul style="list-style-type: none"> <li>• Increased costs/prices</li> <li>• Lower revenue/sales</li> <li>• Loss of jobs</li> </ul>	<ul style="list-style-type: none"> <li>• For food crops.</li> <li>• For beekeepers' services/replacement of hives.</li> <li>• For manual pollination.</li> <li>• For attraction of native pollinators by planting wildflowers/native flowering plants OR providing nesting sites and safe foraging areas.</li> <li>• For better nutrition/medicine for bees.</li> <li>• Because of lower crop yields.</li> <li>• Because of lower honey production.</li> </ul>

**AP® ENVIRONMENTAL SCIENCE  
2011 SCORING GUIDELINES**

**Question 1 (continued)**

**(d) Pollination by native insects is considered an ecosystem service. Identify a different ecosystem service and explain how that service benefits human society.**

*(2 points; 1 point for the identification and 1 point for its linked benefit. Only the first answer is scored.)*

<b>Ecosystem service</b>	<b>Benefit</b>
Control of pests with natural predators	<ul style="list-style-type: none"> <li>Reduces incidence of disease (vector-borne).</li> <li>Reduces need for pesticides.</li> <li>Reduced crop losses.</li> </ul>
Waste disposal/treatment	<ul style="list-style-type: none"> <li>Decomposition reduces amount of waste.</li> <li>Recycles nutrients (plant growth).</li> <li>Detoxification, removal of pollutants.</li> </ul>
Filtering/purification of water by soils and plants	<ul style="list-style-type: none"> <li>Reduces costs of providing safe drinking water.</li> <li>Less contamination/fewer waterborne diseases.</li> </ul>
Storage and regulation of water supplies (water cycle)	<ul style="list-style-type: none"> <li>Reduces costs of creating fresh water (reverse osmosis).</li> <li>Supports growth of agricultural crops.</li> <li>Allows transport of goods.</li> <li>Allows manufacturing of goods.</li> <li>Water is necessary for survival.</li> </ul>
Disposal/dilution of fecal waste	<ul style="list-style-type: none"> <li>Reduced incidence of disease.</li> <li>Reduced cost of sewage treatment.</li> </ul>
Cycling of nutrients (such as nitrogen/phosphorus)	<ul style="list-style-type: none"> <li>Reduces use of inorganic/synthetic fertilizers.</li> <li>Recycles nutrients (plant growth).</li> </ul>
Release of oxygen by plants (oxygen cycle)	<ul style="list-style-type: none"> <li>Necessary for human survival.</li> </ul>
Prevention of soil erosion (roots)	<ul style="list-style-type: none"> <li>Reduces costs of soil amendment/fertilizer.</li> </ul>
Flood control and moderation of the effects of severe storms (storm surges) through absorption of water	<ul style="list-style-type: none"> <li>Protection of human lives.</li> <li>Lower cost for loss of human property.</li> </ul>
Lumber/timber	<ul style="list-style-type: none"> <li>Building, fuel, paper products.</li> <li>Provides income for loggers, paper industry.</li> <li>Difficult or expensive to replace/duplicate (synthetics often use petrochemicals).</li> </ul>
Cycling of carbon	<ul style="list-style-type: none"> <li>Vital to crop growth.</li> <li>Helps in moderation of global temperature.</li> </ul>
Medicines to treat diseases	<ul style="list-style-type: none"> <li>Provides income to harvesters.</li> <li>Improves quality of human life (e.g., cancer and diabetes drugs).</li> </ul>
Genes for resistance to pathogens and crop pests	<ul style="list-style-type: none"> <li>Reduces costs of pesticides.</li> <li>Reduces use of fossil fuels.</li> </ul>
Fish, game, fruit, nuts	<ul style="list-style-type: none"> <li>Source of food for hunters, gatherers, fishers.</li> </ul>
Soil formation, maintenance of soil nutrients	<ul style="list-style-type: none"> <li>Reduces costs of fertilizer/soil amendment.</li> </ul>
