

2018 AP® COMPUTER SCIENCE A FREE-RESPONSE QUESTIONS

4. This question involves reasoning about arrays of integers. You will write two static methods, both of which are in a class named `ArrayTester`.

```
public class ArrayTester
{
    /**
     * Returns an array containing the elements of column c of arr2D in the same order as
     * they appear in arr2D.
     * Precondition: c is a valid column index in arr2D.
     * Postcondition: arr2D is unchanged.
     */
    public static int[] getColumn(int[][] arr2D, int c)
    { /* to be implemented in part (a) */ }

    /**
     * Returns true if and only if every value in arr1 appears in arr2.
     * Precondition: arr1 and arr2 have the same length.
     * Postcondition: arr1 and arr2 are unchanged.
     */
    public static boolean hasAllValues(int[] arr1, int[] arr2)
    { /* implementation not shown */ }

    /**
     * Returns true if arr contains any duplicate values;
     * false otherwise.
     */
    public static boolean containsDuplicates(int[] arr)
    { /* implementation not shown */ }

    /**
     * Returns true if square is a Latin square as described in part (b);
     * false otherwise.
     * Precondition: square has an equal number of rows and columns.
     * square has at least one row.
     */
    public static boolean isLatin(int[][] square)
    { /* to be implemented in part (b) */ }
}
```

2018 AP® COMPUTER SCIENCE A FREE-RESPONSE QUESTIONS

- (a) Write a static method `getColumn`, which returns a one-dimensional array containing the elements of a single column in a two-dimensional array. The elements in the returned array should be in the same order as they appear in the given column. The notation `arr2D[r][c]` represents the array element at row `r` and column `c`.

The following code segment initializes an array and calls the `getColumn` method.

```
int[][] arr2D = { { 0, 1, 2 },  
                  { 3, 4, 5 },  
                  { 6, 7, 8 },  
                  { 9, 5, 3 } };  
  
int[] result = ArrayTester.getColumn(arr2D, 1);
```

When the code segment has completed execution, the variable `result` will have the following contents.

`result: {1, 4, 7, 5}`

WRITE YOUR SOLUTION ON THE NEXT PAGE.

2018 AP® COMPUTER SCIENCE A FREE-RESPONSE QUESTIONS

Complete method `getColumn` below.

```
/** Returns an array containing the elements of column c of arr2D in the same order as they
 * appear in arr2D.
 * Precondition: c is a valid column index in arr2D.
 * Postcondition: arr2D is unchanged.
 */
public static int[] getColumn(int[][] arr2D, int c)
```

2018 AP® COMPUTER SCIENCE A FREE-RESPONSE QUESTIONS

- (b) Write the static method `isLatin`, which returns `true` if a given two-dimensional square array is a *Latin square*, and otherwise, returns `false`.

A two-dimensional square array of integers is a Latin square if the following conditions are true.

- The first row has no duplicate values.
- All values in the first row of the square appear in each row of the square.
- All values in the first row of the square appear in each column of the square.

Examples of Latin Squares

1	2	3
2	3	1
3	1	2

10	30	20	0
0	20	30	10
30	0	10	20
20	10	0	30

Examples that are NOT Latin Squares

1	2	1
2	1	1
1	1	2

1	2	3
3	1	2
7	8	9

1	2
1	2

Not a Latin square
because the first row
contains duplicate
values

Not a Latin square
because the elements of
the first row do not all
appear in the third row

Not a Latin square
because the elements of
the first row do not all
appear in either column

The `ArrayTester` class provides two helper methods: `containsDuplicates` and `hasAllValues`. The method `containsDuplicates` returns `true` if the given one-dimensional array `arr` contains any duplicate values and `false` otherwise. The method `hasAllValues` returns `true` if and only if every value in `arr1` appears in `arr2`. You do not need to write the code for these methods.

Class information for this question

```
public class ArrayTester  
  
    public static int[] getColumn(int[][] arr2D, int c)  
    public static boolean hasAllValues(int[] arr1, int[] arr2)  
    public static boolean containsDuplicates(int[] arr)  
    public static boolean isLatin(int[][] square)
```

AP® COMPUTER SCIENCE A

2018 SCORING GUIDELINES

Question 4: Latin Squares

Part (a)	getColumn	4 points
-----------------	-----------	-----------------

Intent: Create a 1-D array that contains the values from one column of a 2-D array

- +1 Constructs a new `int` array of size `arr2D.length`
- +1 Accesses all items in one column of `arr2D` (*no bounds errors*)
- +1 Assigns one element from `arr2D` to the corresponding element in the new array
- +1 **On exit:** The new array has all the elements from the specified column in `arr2D` in the correct order

Part (b)	isLatin	5 points
-----------------	---------	-----------------

Intent: Check conditions to determine if a square 2-D array is a Latin square

- +1 Calls `containsDuplicates` referencing a row or column of `square`
- +1 Calls `hasAllValues` referencing two different rows, two different columns, or one row and one column
- +1 Applies `hasAllValues` to all rows or all columns (*no bounds errors*)
- +1 Calls `getColumn` to obtain a valid column from `square`
- +1 Returns `true` if all three Latin square conditions are satisfied, `false` otherwise

Question-Specific Penalties

- 1 (r) incorrect construction of a copy of a row
- 1 (s) syntactically incorrect method call to any of `getColumn()`, `containsDuplicates()`, or `hasAllValues()`

Question 4: Scoring Notes

Part (a) getColumn		4 points	
Points	Rubric Criteria	Responses earn the point if they...	Responses will not earn the point if they...
+1	Constructs a new int array of size arr2D.length		<ul style="list-style-type: none"> only create an ArrayList
+1	Accesses all items in one column of arr2D (<i>no bounds errors</i>)	<ul style="list-style-type: none"> declare the new array of an incorrect size and use that size as the number of loop iterations 	<ul style="list-style-type: none"> switch row and column indices
+1	Assigns one element from arr2D to the corresponding element in the new array		<ul style="list-style-type: none"> use ArrayList methods to add to array
+1	On exit: The new array has all the elements from the specified column in arr2D in the correct order		<ul style="list-style-type: none"> switch row and column indices do not use an index when assigning values to the array
Part (b) isLatin		5 points	
Points	Rubric Criteria	Responses earn the point if they...	Responses will not earn the point if they...
+1	Calls containsDuplicates referencing a row or column of square	<ul style="list-style-type: none"> reference any row or column of square, even if the syntax of the reference is incorrect 	
+1	Calls hasAllValues referencing two different rows, two different columns, or one row and one column	<ul style="list-style-type: none"> reference any two distinct rows, two distinct columns, or a row and column of square, even if the syntax of the reference is incorrect 	
+1	Applies hasAllValues to all rows or all columns (<i>no bounds errors</i>)		<ul style="list-style-type: none"> only reference one array in the call to hasAllValues
+1	Calls getColumn to obtain a valid column from square		<ul style="list-style-type: none"> reverse parameters
+1	Returns true if all three Latin square conditions are satisfied, false otherwise	<ul style="list-style-type: none"> test the three sets of conditions and return the correct value 	

Return is not assessed in Part (a).

Question 4: Latin Squares

Part (a)

```
public static int[] getColumn(int[][] arr2D, int c)
{
    int[] result = new int[arr2D.length];

    for (int r = 0; r < arr2D.length; r++)
    {
        result[r] = arr2D[r][c];
    }
    return result;
}
```

Part (b)

```
public static boolean isLatin(int[][] square)
{
    if (containsDuplicates(square[0]))
    {
        return false;
    }

    for (int r = 1; r < square.length; r++)
    {
        if (!hasAllValues(square[0], square[r]))
        {
            return false;
        }
    }

    for (int c = 0; c < square[0].length; c++)
    {
        if (!hasAllValues(square[0], getColumn(square, c)))
        {
            return false;
        }
    }

    return true;
}
```

These canonical solutions serve an expository role, depicting general approaches to solution. Each reflects only one instance from the infinite set of valid solutions. The solutions are presented in a coding style chosen to enhance readability and facilitate understanding.
